Hardy, Pedigreed Northern Field-Grown

City, Farm, and Suburban Homes

# PRICE LIST

No. 25-1

W. Stuart & Co. C

ESTABLISHED 1852 Newark, New York State

## It is conceded that

5%

of the building cost of a home invested in Nursery Stock for lawn and yard decoration, increases the property value at least

20%

# FALL PLANTING

In most sections everything can be planted with perfect safety in the Fall and fine results obtained.

In extremely cold sections we recommend Spring planting for Perennials, Privet Hedging, Evergreens, Everblooming Roses, Peach Trees, Raspberries and Strawberries and recommend Fall planting of everything else. This refers to Maine, New Hampshire, Vermont, Northern New York, Northern Michigan and Northern Wisconsin.

We urge Fall orders because experience shows our customers are well pleased with results when they plant in the Fall.

# SPECIAL CUSTOMER BONUS on Orders of \$10.00 and over

There is a considerable saving in handling larger orders, which saving we are glad to pass along to our customers. Therefore, we will allow a bonus of 10% in Free Nursery Stock (customer's selection) on every order of \$10.00 or more ordered at prices quoted in this Price List.

## **Caution To Salesman**

Customer's Bonus of 10% additional Nursery Stock given FREE OF EXTRA COST with orders of \$10.00 and over must be plainly marked on order blank, "Free Bonus Stock."

# **IMPORTANT NOTICE**

No advance payment is required on orders of \$2.00 or over. Due to the cost of bookkeeping and handling small accounts, orders for less than \$2.00 should be sold for cash, to be paid by the customer at the time the order is booked.

# A COMMON-SENSE TALK ON QUALITY

Remember Topsy, the little pickaninny of Uncle Tom's Cabin? Topsy "jest growed."

But Superior Quality Nursery Stock doesn't "jest grow."

No indeed! Superior Quality Nursery Stock is the result of ideal climate, good rich soil and exacting care combined with:

## Five Points of Superiority That Result in Genuine Satisfaction to You

#### Pedigreed Parentage

Shield-Type Budding Protection Scientific Root and Top Pruning Nu-Way Spacing

#### Entire Root-Wrap Moisture Control

The now famous Five Point Program of Superiority is winning hosts of friends every season. That's the best proof of the Prize Winning Quality of stock produced as a result of these five scientific steps in propagation.

## **Pedigreed Parentage**

Why does one apple tree come into bearing a year or two earlier than another? PEDIGREED PARENTAGE! Why are apples on the good tree larger, heavier, juicier, of a fine, full bodied rich flavor and of excellent keeping qualities, while from the ordinary tree that "jest growed" the fruit is sparce and small and of a decidedly poor flavor? PEDIGREED PARENTAGE!

Why does a superior quality shrub or rose in the home owner's garden develop into a vigorous, hardy, full sized plant bearing a profusion of large, strong-stemmed, brilliantly colored blooms, while the ordinary bush is a comparative weakling? PEDIGREED PARENTAGE!

Pedigreed Parentage means selecting and discarding, picking and choosing, till exactly the right seedling stock is obtained and then the union (or marriage) with it of the finest and most appropriate type of budding stock.

That is Pedigreed Parentage!

### **Shield Type Budding Protection**

Scientific experiments have definitely shown that the methods of budding formerly employed, where this important operation was done in the cheapest way, resulted in nursery stock distinctly inferior to Pedigreed Stock.

To meet the exacting standards of Shield Type Budding Protection the cut which is made in the seedling (root stock) for the purpose of inserting the bud (variety stock), is a Shield Type incision.

The operation must be done at exactly the right time, when both the seedling and bud variety are in proper condition for growth. The bud must be of just the proper maturity to slide in the incision without forcing, which might injure the bud and weaken the plant.

SHIELD TYPE BUDDING PROTECTION is a most important factor in the production of finest quality nursery stock of genuine value.

### Scientific Root and Top Pruning

Scientific Root and Top Pruning replaces the ordinary haphazard methods, which so often result in inferior grades and disappointment to the home owner, with exact scientific methods that are sure to please.

Tests have demonstrated that ideal root and top pruning are absolutely essential to the production of Nursery Stock that is really superior in quality.

Leader Removal, that is the cutting out of part of the main branch or leader, is a type of pruning essential in the case of many varieties. It retards natural growth to obtain a heavy, well-branched, wellshaped tree or plant.

In other varieties, tests have demonstrated that heavy, bushy, shapely specimens are best obtained by Multiple Top Pruning, at predetermined intervals, throughout the growing period at the Nursery Farms.

Scientific Pruning develops an unusually heavy, compact root system, that permits transplanting with a minimum degree of shock and a consequent minimum interruption to natural growth.

That is why it is possible to offer our customers the protection of an exceptionally liberal replacement guarantee.—"IT GROWS OR WE REPLACE IT FREE OF EXTRA CHARGE."

### **Entire Root-Wrap Moisture Control**

Superior Quality Nursery Stock, handled and packed by the New Moisture Control, Entire Root-Wrap Method, insures arrival at customers' homes in the same field-fresh, ready-to-grow condition as when dug at the Nursery Farms.

Nursery Stock that is allowed to get too dry becomes permanently damaged and results in stunted, scrawny specimens, which never develop their natural beauty and productiveness.

If packed too wet, stock may become soft—premature growth may start and overheat in transit. When planted, unnatural growth may result in lack of root nourishment to keep pace with top development —and the plant withers and dies.

The new MOISTURE CONTROL ENTIRE ROOT-WRAP METHOD eliminates all these troubles. Each shipment—each individual piece of stock—receives exactly the right amount of moisture for delivery as Mother Nature intended, in ideal condition for successful planting. That means satisfied customers.

Snowball, Japan, white, 2 to 3 ft., MT	1.45	4.15
Snowberry, white berries, 2 to 3 ft., MD	.85	2.45
The Snowberry is a shrub of great value—for its fine foliage— slender gracefully bending branches—dainty pink blossoms in June and July. It will thrive in dry barren soil—it will grow in		

shade so dense that almost nothing else will grow. Large white berries in Fall are very decorative. There is a Shrub Bargain Group to meet your needs.

See page 30.

Sunburst, yellow deepening toward orange	
Sunkist, coppery-orange, a rose kissed by the sun	
Templar, clear sparkling crimson	95
Talisman, vivid red and gold	
Ville de Paris, rich buttercup yellow	
Wilhelm Kordes, golden, copper and red tints	

## **Always Plant Thorobred Roses**

Superior quality Roses are all strong, vigorous, field-grown bushes. Not spindly, green-house or southern-grown weaklings.

Here's the reason—for propagating Pedigreed Roses, the type of root stock selected is particularly selected for the variety to be grown.

Only certain types of strong growing, disease resisting, hardy root stocks are used. Some of these root stocks are imported from Holland and France. Others are grown in certain sections of the United States.

After the hardy root stock has grown for one year or more, the desired variety is then budded, by the Shield Type Protection Budding Process.

The budded stock is then allowed to grow for two years, into a strong, vigorous bush, full of vitality and ready-to-bloom in your garden.

The "best" Roses are produced from Pedigreed Parents and budded on hardy, strong growing root stock. Therefore, you can readily see why only the "best" quality roses should be planted on your home grounds. Don't be fooled, by cheap inferior rose bushes—plant our ROSES and enjoy magnificent, lovely, fragrant Roses in you garden.

# A COMMON SENSE TALK ON QUALITY

(Continued From Page 3)

#### **Nu-Way Spacing**

Have you ever noticed when driving past a piece of woods, what appeared to be a nice, shapely Evergreen or Shade Tree?

It takes your eye. You get out, walk back in the woods to examine it, but to your disappointment, find it's a fine shapely tree on one side only—and on the other side, ill-shaped, unbranched and unsightly.

What's the cause?

The shapely side enjoyed plenty of room to develop. It received its share of sunlight. The other side was crowded in a density of other growth. Crowding and lack of sunlight are sure to result in unsightly, ill-shaped trees and plants.

With NU-WAY SPACING, trees and plants have plenty of room for cross cultivation, both in the rows and between the rows. They enjoy plenty of sunlight. There is sufficient space for perfect development.

This Nu-Way Spacing method of propagation requires nearly double the acreage to grow the same quantity as compared with the Crowding plan used for growing "cheap stock."

Nu-Way Spacing produces round, bushy, shapely trees and plants —trees and plants that fulfill every expectation of our customers. All sizes of Fruit Trees refer to height above roots.

The original plant that produces these new plants we sell is not allowed to prothe original plant that produces these new plants we sen is not another to pro-duce Fruit. Thus, the surplus growing strength and vigor that would ordinarily be consumed in producing strawberries is transmitted by nature from the Mother plant to her offspring, resulting in producing vigorous, heavy-rooted, top quality plants, capable of bearing profitable crops of First Quality Berries for our customer. Only the plants that develop close to the Mother plant are used. Weak, inferior Only the plants that develop close to the Mother plant are used. Weak, inferior quality plants that grow at the end of the runners are not used in filling our orders. Compare these rigid methods with what could be used if our aim or motto was, "Not how good but how cheap"

"Not how good, but, how cheap." Suppose the mother plant was allowed to produce Fruit—Sold the fruit for profit, then later sold the plants to the unsuspecting public. Naturally, we could sell such plants at low price and still be ahead. We will not sell a customer a plant or tree of any kind that we would not plant.

ourselves.

Strawberrie : 1 x 4 ft.—10,890 Plants

To estimate the number of plants required for an acre at any given distance, multiply the distance between the rows by the distance between the plants, which will give the number of square feet allotted to each plant, and divide the number of square feet in an acre (43,560) by this number. The quotient will be the number of plants required.

## AGE AT WHICH DIFFERENT TREES USUALLY FRUIT

#### XXX Size Only

This varies greatly with different varieties. Such apples as "Yellow Transparent" and "Duchess of Oldenburg" often fruit the second year, while "Northern Spy" seldom fruit in less than ten years after transplanting, though it is one of the best apples and a prolific yielder when of bearing age. The average time after planting is, for

# **Good Trees Are Great Money Makers**

By SAMUEL FRAZER

(From The American Agriculturist)

Think of the time and energy which the planter and his children will waste growing a scrub tree when they might be reaping dollars by caring for a good one! We never get something for nothing. It costs more to grow a tree right than to grow a scrub.

The public can get what it pays for and no more. The fruit grower who wants a tree well-grown on first-class roots, propagated with care will have to pay enough to reimburse for the additional expense in propagating.

#### **GETTING YOUR MONEY'S WORTH**

The possibility of the tree repaying the expenditure depends to an enormous extent upon the judgment used in the first purchase. If a cheap, poorly grown tree is planted, one may never get the reward.

It is interesting to note that the yield of the bearing trees of the United States is frequently one-tenth of a barrel per tree; in other words, there are a lot of drones in the orchards. For the live producers the important question is: Am I going to plant a drone tree or a producer?

#### PEDIGREED TREES PAY BIG

There are apple orchards which are averaging 10 barrels a tree. These orchards for a term of years will run in a gross revenue from \$20.00, to as high as \$40.00 a tree; in other words, one single apple tree will turn in as much money as an acre of beans or wheat or as much revenue as the average cow and have to feed her three times a day and milk her twice.

The same farmer who is going to buy an apple tree, when he contemplates purchasing a horse will always prefer and pay more for a well-bred, well put up, close-coupled work horse, because he can do more work. If he is well-bred he is worth more than a scrub.

He will pay more for a cow capable of producing 10,000 pounds of milk than for one whose maximum is 4,000. Why not use the same judgment in buying trees?
